

ID	3613
Curricular Unit	Cognitive Psychology
Regent	Paulo Noriega
Learning Outcomes	In view of the growing mental demands in work and the areas of ergonomics design and usability, ergonomics must stress elements about human cognition. A complete ergonomic analysis may not dispense knowledge about human information processing. Therefore, cognitive psychology aims at the study of cognitive structures and processes related with human information processing. In short, the issues explored in this discipline are: how do we gather information, store it, represent it and process it in order to solve problems and make decisions.
Syllabus	Introduction to Cognitive Psychology; Perception; Mental Imagery; Attention; Memory; Knowledge Representation; Language; Thinking; Methodological issues in cognitive psychology.
Evaluation	Theoretical concepts are presented and discussed orally, backed by PowerPoint and various multimedia contents. These are articulated with a theoretical and practical component where students experience some psychological assessment instruments and also perform replications of cognitive psychology classic experiments. Besides the material made available online by the teacher, several literature sources in the area of cognitive psychology are advised. Students can choose either continuous or final exam review. In continuous evaluation students have a practice-laboratory component and a theoretical one. The practice-laboratory component, with a weighting of 30% of the final grade, is assessed using two tests and the theoretical one, with a weighting of 70%, is assessed in four trials. The assessment by exam is conducted only one exam worth 100% of the grade.
