Curricular Unit Sport Physiology

Regent

João Nuno Seabra da Costa Rasoilo

Learning Outcomes

Be able to demonstrate knowledge of the main physiologic mechanisms of acute and chronic adaptation to systematic sports training. Be able to analyze the physiologic demands of different sports. Know how to apply physiologic and functional evaluation techniques.

Basic and applied physiology. Acute and chronic adaptations to exercise. Historical events. Sports trainingand characterization of the training load. Genetics of physical fitness. Energy metabolism and cellular mechanisms of ATP re-synthesis. Main physiologic support systems to energy transfer. Mechanisms of the O2 supply chain. VO2 kinetics, intensity domains and intensity levels. Evaluation of the power and capacity

Syllabus

of the energy systems: ergometry; measuring techniques of physiologic variables and parameters; evaluation of anaerobic and aerobic energy production. Analysis of sports demands: physiologic classification criteria. Physiologic training control. Training, muscular fatigue and overtraining. Environmental factors: hypobaric environment and altitude training; hyperbaric environment, underwater exercise and sports diving; temperature, thermoregulation and acclimatization; circadian rhythms and jetlag influences. Warm-up and cool-down. Training, tapering and detraining.
